

SMART INDIA HACKATHON 2026

- Problem Statement ID - **SIH26084**
- Problem Statement Title - **Convective scale nowcasting for Thunderstorms, Hail & Cloudbursts (06 hr)**
- Theme - **Disaster Management**
- PS Category - **Software**
- Team ID - **137710**
- Team Name - **TRIKAAL**

PROBLEM EXISTING

- **Too Coarse and Slow** : NWP resolves about **11–25 km**; which cannot resolve **1–10 km, 15–180 min** storms.
- **Scattered data** : Radar, INSAT, lightning and NWP sit in separate systems with no common grid.
- **Black-box warnings** : Forecasters can't see why a cell was flagged.
- **Alert gaps** : Warnings are not localised, not multilingual, and there is no reviewed path from model to public alert.

PROPOSED SOLUTION

- **Dense optical flow** : Farneback tracks storm motion pixel by pixel from consecutive reflectivity grids.
- **Five hazard heads** : Hail, downburst, cloudburst, lightning density and convective initiation.
- **Explainable severity** : A **4-level** class (INFO/WATCH/WARNING/SEVERE) with real SHAP attributions.
- **Human-in-the-Loop CAP** : Officer approves, rejects or cancels, each with a reason and an audit trail.
- **1–3 km display grid** : Interpolated from NWP, and labelled as such.

WHAT MAKES VAYUGATI DIFFERENT

- **Proven, not claimed** : Scored against persistence (CSI, POD, FAR, FSS); test-storm speed recovered **within 1 km/h**.
- **Anchored to a real disaster** : Verified against the 2010 Leh cloudburst (**~200 dead**) using NASA GPM IMERG archives.
- **Governed** : The database enforces officer approval, with an immutable audit log.
- **Real multi-source data** : Live Open-Meteo NWP + archived MOSDAC INSAT-3DR + NASA IMERG, each status-labelled.
- **VayuGati Saarthi** : An AI chat guide that explains approved alerts and portal features in the user's language.

TODAY — THE PROBLEM

VAYUGATI — THE SOLUTION

**TECHNICAL**

Open-source, CPU-only

- ✓ FastAPI + OpenCV Farneback + scikit-learn/SHAP run on CPU.
- ✓ Docker Compose build, adapters for IMD radar, INSAT and lightning feed one schema.

**OPERATIONAL**

Advisory overlay on today's process

- ✓ The forecaster reviews every alert; approve, reject or cancel with a reason.
- ✓ Role-based portals; no change to IMD field protocols.

**ECONOMIC**

Software only

- ✓ No new radar, sensor or IoT hardware.
- ✓ Open-source stack; prototype runs on Supabase and Vercel tiers.

**SAFETY**

Human-gated, honestly labelled

- ✓ Database-enforced DRAFT → REVIEW → APPROVED, with an immutable audit log.
- ✓ LIVE / CACHED / OFFLINE / SIMULATED badge on every feed.

 **VAYUGATI recommends; the Forecaster decides.** No alert reaches the public without approval.

STANDARDS & SAFETY BASIS

NDMA Lightning Guidelines (2020)

Lightning safety, public awareness and risk mitigation.

<https://ndma.gov.in/>

Common Alerting Protocol (CAP)

Standardized, interoperable emergency alert messages.

<https://docs.oasis-open.org/emergency/cap/v1.2/CAP-v1.2-os.html>

NCRB — Accidental Deaths & Suicides in India

Official statistics for lightning-related fatalities and disaster impact.

<https://www.ncrb.gov.in/>

REAL DATA SOURCES

NASA GPM IMERG — V07

Satellite-derived precipitation estimates for historical rainfall analysis and validation.

<https://gpm.nasa.gov/data/directory>

MOSDAC — INSAT-3D/3DR

Satellite imagery and meteorological products for cloud monitoring.

<https://mosdac.gov.in/>

NASA GES DISC — Giovanni

Precipitation datasets, visualization and historical data analysis.

<https://giovanni.gsfc.nasa.gov/giovanni/>

Multi-Source Meteorological Data

Doppler Weather Radar • INSAT-3D/3DR • Lightning Detection Networks
